(54) Title: SYNTHETIC INHIBITORS OF MAMMALIAN COLLAGENASE

## (57) Abstract

The present invention relates to compounds of the formula  $R_1SCH(R_2)CH(R_3)CO-AA_1[AA_2]_m[AA_3]_n-X$ , wherein  $m$  is the integer 0 or 1;  $n$  is an integer from 0-2;  $AA_1$  is a hydrophobic amino acid;  $AA_2$  is an amino acid selected from the group consisting of alanine, glycine, leucine, isoleucine, phenylalanine;  $AA_3$  is any amino acid;  $R_1$  is hydrogen, alkyl having from 1-10 carbon atoms, alkanoyl having from 2-10 carbon atoms, or aroyl having from 7-10 carbon atoms;  $R_2$  is hydrogen or alkyl having from 1-6 carbon atoms;  $R_3$  is hydrogen, alkyl having from 2-10 carbon atoms, cycloalkyl having from 3-6 carbon atoms, aryl or arylalkyl, wherein aryl moieties have from 6-10 carbon atoms;  $X$  is  $NH_2$ ,  $OH$ ,  $OCH_3$ , or  $OCH_2CH_3$ ; and salts thereof.

NEW SYNTHETIC INHIBITORS OF MAMMALIAN COLLAGENASE  
 WHICH ARE PEPTIDES TERMINATED BY AN OPT. SUBST.  
 THIOGP. MERCAPTO/PROPIONYL GP.

88285404

# SYNTHETIC INHIBITORS OF MAMMALIAN COLLAGENASE

Compounds which coordinate to the zinc active site have the ability to inhibit the activity of the collagenase. Because of the clinical importance and the desirability of

35

-2-

25

30

35

-3-

inhibitor. Deleusse, et al. (Biochem Biophys. Res. Comm. 133: 483-490, 1985) also refer to an inhibitor N-[3-N-(benzyloxy-carbonyl)amino-1-(R)-carboxypropyl]-L-leucyl-O-methyl-L-tyrosine-N-methylamide. Gray, et al. (Biochem. Biophys. Res. Comm. 101: 1251-1258, 1981) disclose a number of thiol-containing analogues of the collagen cleavage site. Additional thiol-containing peptides are disclosed by Gray, et al. in J. Cell Biochem., 32: 71-77, 1986. Carboxyalkyl peptide analogues are described by Gray, et al. in Federation Proc. 44: 1431, 1985. Miller, et al. also disclose thiol-containing peptides in an abstract. [Fed. Proc. 45: 1859 (1986)].

Despite the large number of compounds showing inhibitory properties, the therapeutically useful commercially available compounds are very few in number and are not altogether satisfactory in all respects for clinical use. Therefore, a continued need exists for an extremely potent and highly specific collagenase inhibitor which will have widespread therapeutic and commercial application. It has now been discovered that a small class of novel thiol-containing peptides provides a level of collagenase inhibition not heretofore observed in the known inhibitory compounds.

The present invention relates to peptides of the formula:

wherein m is the integer 0 or 1; n is an integer from 0-2;

AA<sub>1</sub> is a hydrophobic amino acid;

AA<sub>2</sub> is an amino acid selected from the group consisting of alanine, glycine, leucine, isoleucine and phenylalanine;

-4-

1           AA<sub>3</sub> is any amino acid;

          R<sub>1</sub> is hydrogen, alkyl having from 1-10 carbon atoms, alkanoyl having from 2-10 carbon atoms, or aroyl having from 7-11 carbon atoms;

5           R<sub>2</sub> is hydrogen or alkyl having from 1-6 carbon atoms;

          R<sub>3</sub> is hydrogen, alkyl having from 2-10 carbon atoms, cycloalkyl having from 3-6 carbon atoms, aryl or arylalkyl, wherein the aryl moiety has from 6-10 carbon atoms;

10           X is NH<sub>2</sub>, OH, -OCH<sub>3</sub> or -OCH<sub>2</sub>CH<sub>3</sub>; and salts thereof.

          In the formulation hereinabove, the group R<sub>1</sub>SCH(R<sub>2</sub>)-CH(R<sub>3</sub>)CO, forms a peptide bond with the amino group of AA<sub>1</sub>. Similarly, it is understood that whenever AA<sub>2</sub> or AA<sub>3</sub> are present, the various amino acids, AA<sub>1</sub>, AA<sub>2</sub> and AA<sub>3</sub> are linked together by peptide bonds between the carboxy group of one amino acid moiety, and the amino group of the subsequent amino acid residue in the chain. For example, if in Formula I, m and n are both 1, then a peptide linkage is formed between the carboxy group of AA<sub>1</sub> and the amino group of AA<sub>2</sub> and another peptide is formed between the carboxy group of AA<sub>2</sub> and the amino group of AA<sub>3</sub>.

20           The present invention also encompasses pharmaceutical compositions containing the aforementioned peptides as well as a method of treatment of collagenase-related disorders which comprises administration of an inhibitory effective amount of one or more of the claimed peptides.

25           The term "amino acid" as used herein refers to an organic acid whose molecule contains both a carboxyl group (COOH) and an amino group coupled with an alkyl, aryl or

35

-5-

heterocyclic moiety. It will be understood that the term  
1 amino acid is intended to encompass both natural and  
synthetic residues; unsubstituted as well as mono or  
di-substituted natural amino acids, wherein the substitutes  
are halogen or lower alkyl containing 1 to 6 carbon atoms are  
5 encompassed by the term amino acids. Moreover, it is  
contemplated that n-formyl tryptophan may be employed in any  
position where a tryptophan residue is called for. The  
preferred amino acids contemplated in the present invention  
are the  $\alpha$ -amino acids. The preferred halogen substituent is  
10 chloro and the preferred alkyl substituent is methyl.

The following abbreviations for amino acids will be  
used throughout the specification and claims:

|    |     |   |                 |     |   |            |
|----|-----|---|-----------------|-----|---|------------|
| 15 | Ala | - | Alanine         | Thr | - | Threonine  |
|    | Gly | - | Glycine         | Cys | - | Cysteine   |
|    | Nal | - | Naphthylalanine | Met | - | Methionine |
|    | Leu | - | Leucine         | Pro | - | Proline    |
|    | Ile | - | Isoleucine      | Lys | - | Lysine     |
|    | Ser | - | Serine          | Arg | - | Arginine   |
| 20 | Asp | - | Aspartic Acid   | Asn | - | Asparagine |
|    | Glu | - | Glutamic Acid   | Gln | - | Glutamine  |
|    | Phe | - | Phenylalanine   | Tyr | - | Tyrosine   |
|    | Trp | - | Tryptophan      |     |   |            |

25 The peptides of the present invention represent  
inhibitory, thiol-containing analogues of the carboxyl side  
of the natural cleavage site of the collagen molecule. These  
novel peptides exhibit a very high affinity for this binding  
site of collagenase. The specificity and inhibitory activity  
of these compounds is greater than that observed with any  
30 commercially available collagenase inhibitors. A  
particularly surprising feature of the present peptides is  
the fact that the amino acid adjacent to the metal  
coordinating functionality, i.e. the thiol group, should

35

88285404

1 preferably be a hydrophobic amino acid. This is a departure  
from the arrangement of the natural cleavage site in which  
alanine, an aliphatic neutral amino acid, occupies the  
corresponding position relative to the scissile carbonyl.  
5 Previously described synthetic peptide analogues have  
therefore tended to be constructed along the same lines,  
i.e., using a neutral amino acid such as leucine, isoleucine,  
alanine or glycine adjacent to the metal binding  
functionalities. It thus is particularly unexpected that not  
10 only does the use of a hydrophobic amino acid provide an  
active inhibitor, but it also provides a superior inhibitor.

The peptides of the present invention preferably  
may contain one, and up to four, amino acid residues.  
Additional amino acid residues may be present but do not add  
15 substantially to the activity of the product and simply serve  
to complicate the preparation of the peptide. The peptide  
structure is combined with a thiol-containing functional  
moiety which serves to bind to the zinc at the active site  
with the collagenase enzyme. The thiol-containing moiety in  
the final peptide has the formula:

20 wherein  $R_1$  is hydrogen, alkyl, alkanoyl, or aroyl;  $R_2$  is  
hydrogen or alkyl, and  $R_3$  is hydrogen, alkyl, cycloalkyl,  
aryl or aralkyl. The alkanoyl moieties in the foregoing  
25 formula contain from 2-10 carbon atoms; the preferred  
alkanoyl moiety is acetyl. The aroyl substituents contain  
from 7-11 carbon atoms, with benzoyl being particularly  
preferred. Alkyl moieties contain from 2-10, and preferably  
from 2-6, carbon atoms and may be straight-chain or branched;  
30 isobutyl is the particularly preferred alkyl substituent.  
Aryl and the aryl in arylalkyl contain from 6-10 carbon

-7-

atoms; the preferred aryl is phenyl. It will also be understood that the aryl moieties may be substituted with one, two or three substituents selected from the following alkyl, alkoxy, amino, hydroxy or alkanoyloxy, the alkylalkoxy and alkanoyloxy moieties containing from 1-6 carbon atoms. Overall, the preferred thiol-containing moiety is one in which  $R_1$  is hydrogen,  $R_2$  is hydrogen or methyl and  $R_3$  is alkyl, preferably isobutyl.

As noted above, one of the most essential elements of the peptide is the presence of a hydrophobic amino acid ( $AA_1$ ) at the position one amino acid removed from the carbonyl functionality. In other words, besides the amino group and the carboxy group,  $AA_1$  contains an hydrophobic residue, i.e., is nonpolar. For example, the hydrophobic residue includes but is not limited to an heterocyclic moiety containing 1, 2 or 3 ring heteroatoms selected from the group consisting of nitrogen, oxygen or sulfur in which the ring contains 5-10 ring atoms and 4-9 carbon ring atoms and which may be heteroaryl or partially or fully saturated, e.g., indolyl, (as in tryptophan); an aromatic moiety containing 6 to 10 ring carbon atoms; e.g., phenyl or  $\beta$ -naphthyl, its alicyclic analogs which may be completely saturated or partially saturated e.g., cyclohexyl, and the like. However, the preferred  $AA_1$  contain aromatic or heterocyclic groups. This amino acid may be selected from among the naturally occurring amino acids such as phenylalanine, tryptophan, or tyrosine, or may be a synthetic aromatic amino acid such as naphthylalanine. It is possible to construct a highly effective inhibitor with the presence of a single amino acid of this type, for example, the compounds 1 and 2 of Table 1.

-8-

1       The presence of a second amino acid is usually  
2       preferred and can increase the activity of the inhibitors  
3       substantially. The choice of residue at this position is  
4       also narrowly limited, however, if activity is to be  
5       maximized. The amino acid at this position is preferably  
6       selected from the group consisting of alanine, glycine,  
7       leucine, isoleucine and phenylalanine. The presence of an  
8       alanyl residue at this position drastically increases the  
9       inhibitory capacity of the compounds, and therefore, this  
10      amino acid is particularly preferred. However, although  
11      activity is somewhat reduced, the remaining amino acids of  
12      this group may also occupy this position and still retain a  
13      significant level of inhibitory capacity.

14       The identity of additional amino acids, i.e. AA<sub>3</sub>,  
15      if present, is not particularly critical to the activity of  
16      the inhibitors and therefore may be selected from any of the  
17      twenty amino acids, although the third amino acid is  
18      preferably glutamine, as this mimics the sequence adjacent to  
19      the cleavage site. As noted above, the length of the amino  
20      acid sequence is not particularly critical, and activity may  
21      be retained by the addition of up to as many as twenty or  
22      more amino acid residues. However, since the addition of  
23      several more residues does not significantly enhance the  
24      effectiveness of the compounds and substantially increases  
25      the difficulty of their preparation, it is preferred that the  
26      additional residues be limited to a maximum of two.

27       Any of the amino acids used in the present peptides  
28      may be either the D or the L form; although the use of the D  
29      form may in some positions reduce activity somewhat, it may  
30      in some circumstances be desirable to sacrifice some activity  
31      for increase in stability of the product.

35

2826 88285404

-2-

1 The compounds of the present invention are relatively  
simple to prepare. Preparation of the appropriate thiol acid  
starting materials, which are generally acetyl- protected, is  
achieved by art recognized procedures; a thorough discussion  
of the method of preparation is found in U.S. Patent No.  
5 4,235,885, the teachings of which are incorporated herein by  
reference. The peptides may be prepared by any of the wide  
range of known methods. Among the more commonly used  
techniques are coupling via the dicyclohexylcarbodiimide  
method, or the solid phase Merrifield synthesis, in which a  
10 protected amino acid is bound to a resin particle as an ester  
bond. Amino acids having functional groups such as tyrosine  
are generally protected with an easily removed blocking  
group, which are well known to the skilled artisan. Each of  
these techniques is equally suitable for the present  
15 purposes. The protected peptide is then coupled to the  
appropriate acetyl protected thiol, again by any of the  
typical coupling procedures referred to above. The compounds  
so produced may be purified by chromatography  
electrophoresis, or any other suitable means, and the acetyl  
20 protecting group removed by treatment with dilute  $\text{NH}_4\text{OH}$  in  
nitrogen-flushed methanol.

Therefore, using the techniques discussed hereinabove,  
the compounds of the present invention can be prepared by  
art recognized techniques. For example, compounds of Formula  
25 I can be prepared by reacting an acylating derivative of the  
thiol acid of Formula II

II

-10-

1 with the amino group of  $AA_1$  in the following amino acids sequence of Formula III

5 under amide forming conditions. The coupling may be facilitated by the presence of a coupling reagent, such as dicyclohexylcarbodiimide or 1-Ethyl-3-(3-di-methylamino-isopropyl) carbodimiimide and the like. Protecting groups may also be used in order to minimize side reaction. A  
10 variety of protecting groups known in the art may be employed. Examples of many of these possible groups may be found in "Protective Groups in Organic Synthesis", by T.W. Green, John Wiley and Sons. For example, the thiol acid of  
15 Formula II may be acetyl protected. If desired, the protecting groups can be removed by art recognized techniques, as discussed in "Protective Groups in Organic Synthesis" discussed hereinabove.

The present invention is also intended to encompass salts of the claimed peptides. These compounds form basic  
20 salts with various organic and inorganic bases. Among the salts which may be prepared are ammonium, alkali metal salts, alkaline earth metal salts and salts with organic bases such as dicyclohexamine. In those peptides in which Arg is added, acid addition salts may also be prepared, particularly  
25 acetate or hydrochloride salts. Although for obvious reasons, pharmaceutically acceptable salts are preferred, but the invention is not limited to them since non-pharmaceutically acceptable salts may prove useful in  
isolating the compounds of the invention.

30 The compounds of the invention contain an asymmetric carbon atom (C-2), and therefore exist as

35

88285464

-11-

1 diastereomeric pairs, which can be resolved by chroma-  
tography. The invention therefore includes both the R and S  
isomers which may be used in isolation or as a racemic  
mixture.

5 The compounds disclosed herein have been  
demonstrated to be highly effective inhibitors of mammalian  
collagenase activity as shown in Table 1. Many of the  
compounds are effective even in the nanomolar range, and all  
10 tested compounds have been proven effective in micromolar  
quantities. They may be thus efficiently employed in  
treatment of any mammalian disease in which collagenase has  
been implicated as a causative factor as noted above.  
Formulation of pharmaceutical compositions depends upon the  
nature of the condition to be treated. For example, for  
15 rheumatoid arthritis treatment, intraarticular injection may  
be the preferred mode of administration; the peptides in this  
case or for any other type of parenteral administration, will  
generally be administered with a pharmaceutically acceptable  
carrier such as a sterile solution containing other solutes,  
20 for example, sufficient saline or glucose to make the  
solution isotonic. The peptides may also be formulated into  
tablets or capsules for oral administration in combination  
with stabilizers, excipients, carriers, preservatives, or  
flavors, as is typical in pharmaceutical practice. The  
25 typical dosage is between 10-500 mg/kg of body weight of the  
mammal being treated.

\*IC<sub>50</sub> refers to the approximate concentration of compound giving 50% inhibition of collagen degradation in an in vitro assay system using pig synovial collagenase. Because C-2 (containing the isobutyl side chain) is asymmetric, the compounds exist as diastereomeric pairs which can be resolved by chromatography. Where an individual diastereomer has been assayed, the result for each is reported. In cases where the diastereomers have not been resolved, the IC<sub>50</sub> values were obtained with a mixture containing approximately equal amounts of the two. Since the absolute configuration at C-2 is not known, the diastereomers are identified as 'fast' or 'slow' by their relative elution time from a C<sub>18</sub> reversed phase chromatographic system under standardized conditions.

EXAMPLE 2

Preparation of  $\text{HSCH}_2\text{CH}(\text{CH}_2\text{CH}(\text{CH}_3))\text{CO-L-Phe-L-Ala-NH}_2$

1. t-Butyloxycarbonyl-L-phenylalanyl-L-alanine  
amide. L-Alanine amide hydrobromide (500 mg, 2.95 mmol),  
t-butyloxycarbonyl-L-phenylalanine N-hydroxysuccinimide ester  
(885 mg, 2.95 mmol), and 0.41 ml (2.95 mmol) triethylamine  
were dissolved in 15 ml acetonitrile-methanol (2:1, v:v).  
The mixture was stirred overnight at room temperature. The  
solvent was then removed under reduced pressure at 40°C and  
the residue extracted into ethyl acetate. The extract was  
washed successively with saturated  $\text{NaHCO}_3$ , water, 10% citric  
acid, and water. The organic layer was dried with  $\text{Na}_2\text{SO}_4$  and  
the solvent removed by flash evaporation. The dried product  
weighed 0.6 g (61%).

2. L-Phenylalanyl-L-alanine amide trifluoroacetate.  
The product from step 1 above was dissolved in 3 ml  
trifluoroacetic acid. After 30 min at room temperature, the  
resulting deprotected peptide was precipitated with dry  
ether. The precipitate was collected by filtration,  
trituated with ether and dried. The yield was 0.58 g  
(111%).

3. 2-(R,S)-[(Acetylthio)methyl]-4-methylpentanoyl-L-  
phenylalanyl-L-alanine amide. L-Phenylalanyl-L-alanine amide  
trifluoroacetate (500 mg, 1.43 mmol), 0.2 ml triethylamine  
(1.43 mmol), 293 mg (+)-2-[(acetylthio)methyl]-4-methyl-  
pentanoic acid, and 320 mg (1.43 mmol) dicyclohexylcarbodiimide  
were dissolved in 10 ml of ice-cold acetonitrile-methanol  
(1:1, v:v). The reaction mixture was kept on ice overnight  
and its progress monitored at 210 nm by reversed phase HPLC  
using a  $\text{C}_{18}$  column and a linear gradient of 0.1%  $\text{H}_3\text{PO}_4$  and  
acetonitrile. In order to obtain complete reaction of the

-16-

1 peptide, an additional 530 mg of the protected thiol and 375  
mg of the carbodiimide were added over a 36 hour period. The  
reaction mixture was warmed to room temperature and the  
precipitate removed by filtration. The desired product  
5 peptide derivatives were purified by preparative C<sub>18</sub> reversed  
phase HPLC (0.1% trifluoroacetic acid/acetonitrile) and  
recovered by lyophilization (218 mg, 36%). The resulting  
mixture of diastereomers was separated into two components,  
designated diastereomer 1 and diastereomer 2 by reversed  
10 phase HPLC as above. Gas chromatographic-mass spectral  
analysis of 1 and 2 gave the same fragmentation pattern and  
showed molecular ions of 421.2043 and 421, respectively  
(C<sub>21</sub>H<sub>31</sub>N<sub>3</sub>O<sub>4</sub>S = 421.2035).

4. 2-[(R,S)-Mercaptomethyl]-4-methylpentanovl-L-  
15 phenylalanovl-L-alanine amide. The resolved diastereomers 1  
and 2 were dissolved in 2 ml methanol, flushed with nitrogen  
for 15-30 minutes and treated with 0.2 ml concentrated NH<sub>4</sub>OH  
for 30-60 minutes. The resulting deprotected thiol was  
precipitated by adding water, acidified with acetic acid, and  
the product recovered by lyophilization. For diastereomer 1  
20 (24 mg): TLC R<sub>f</sub> 0.31 (CHCl<sub>3</sub>-MeOH, 10:1), 0.72 (CHCl<sub>3</sub>-MeOH,  
5:1), 0.92 (BuOH-acetic acid-H<sub>2</sub>O, 4:1:1); amino acid  
analysis: Phe:Ala, 1:1.04; Anal. Calcd. for C<sub>19</sub>H<sub>29</sub>N<sub>3</sub>O<sub>3</sub>S  
1.4  
H<sub>2</sub>O: C, 56.38; H, 7.92; N, 10.38; S, 7.92. Found: C, 56.63;  
25 H, 7.55; N, 9.52; S, 8.18. For diastereomer 2 (80 mg): TLC  
R<sub>f</sub> 0.20 (CHCl<sub>3</sub>-MeOH, 10:1), 0.67 (CHCl<sub>3</sub>-MeOH, 5:1), 0.89  
(BuOH-acetic acid-H<sub>2</sub>O, 4:1:1); amino acid analysis; Phe:Ala,

EXAMPLE 3Preparation of  $\text{HSCH}_2\text{CH}[\text{CH}_2\text{CH}(\text{CH}_3)]\text{CO-L-Phe-L-Leu-NH}_2$ 1. t-Butyloxycarbonyl-L-phenylalanyl-L-leucine

amide. L-Leucine amide hydrochloride (500 mg, 2.99 mmol),  
t-butyloxycarbonyl-L-phenylalanine N-hydroxysuccinimide ester  
(1069 mg, 2.95 mmol), and 0.41 ml (2.95 mmol) triethylamine  
were dissolved in 10 ml acetonitrile-methanol (1:1, v:v).  
The mixture was stirred at room temperature overnight. The  
solvent was removed under reduced pressure at 40°C and the  
residue extracted into ethyl acetate. The extract was washed  
successively with saturated  $\text{NaHCO}_3$ , water, 10% citric acid,  
and water. The organic layer was dried with  $\text{Na}_2\text{SO}_4$  and the  
solvent removed by rotary evaporation as above. The dried  
product weighed 0.94 g (83.9%).

2. L-Phenylalanyl-L-leucine amide trifluoroacetate.

The product from step 1 above was dissolved in 3 ml  
trifluoroacetic acid. After 30 min at room temperature, the  
product was precipitated with dry ether. The precipitate was  
collected by filtration, triturated with ether and dried.  
The yield was 0.94 g (108%).

3. 2-(R,S)-[(Acetylthio)methyl]-4-methylpentanoyl-L-phenylalanyl-L-leucine amide.

L-Phenylalanyl-L-leucine  
amide trifluoroacetate (780 mg, 2.0 mmol), 0.28 ml  
triethylamine (2.0 mmol), 409 mg (+)-2-[(acetylthio)methyl]-  
4-methylpentanoic acid, and 513 mg (2.0 mmol)  
dicyclohexylcarbodiimide were dissolved in 10 ml ice-cold  
acetonitrile-methanol (1:1, v:v). The reaction mixture was  
kept on ice overnight and its progress monitored at 210 nm by  
reversed phase HPLC using a  $\text{C}_{18}$  column and a linear gradient  
of 0.1%  $\text{H}_3\text{PO}_4$  and acetonitrile. In order to obtain complete  
reaction of the peptide, and additional 530 mg of the

-13-

protected thiol and 375 mg of the carbodiimide were added over a 36 hour period. The reaction mixture was warmed to room temperature and the precipitate removed by filtration. The product peptide derivatives were purified by preparative C<sub>18</sub> reversed phase HPLC (0.1% trifluoroacetic acid/acetonitrile) and recovered by lyophilization (440 mg, 47.5%). The resulting mixture of diastereomers were separated into two components, designated diastereomer 1 and diastereomer 2, by reversed phase HPLC as described above.

4. 2-[(R,S)-Mercaptomethyl]-4-methylpentanoyl-L-phenylalanyl-L-leucine amide. Each of the diastereomers were dissolved in 5 ml methanol, flushed with nitrogen for 15-30 minutes and treated with 0.5 ml concentrated NH<sub>4</sub>OH for 30-60 minutes. The resulting deprotected thiol was precipitated by adding water, acidified with acetic acid, and the product recovered by lyophilization. For diastereomer 1 (175 mg): TLC R<sub>f</sub> 0.19 (CHCl<sub>3</sub>-MeOH, 10:1), 0.69 (CHCl<sub>3</sub>-MeOH, 5:1), 0.97 (BuOH-acetic acid-H<sub>2</sub>O, 4:1:1); amino acid analysis: Phe:Leu, 1:0.98; Anal. Calcd. for C<sub>22</sub>H<sub>35</sub>N<sub>3</sub>O<sub>3</sub>S 1.2 H<sub>2</sub>O: C, 59.62; H, 8.51; N, 9.48; S, 7.23. Found: C, 59.66; H, 8.51; N, 9.89; S, 6.61. For diastereomer 2 (160 mg): TLC R<sub>f</sub> 0.16 (CHCl<sub>3</sub>-MeOH, 10:1), 0.67 (CHCl<sub>3</sub>-MeOH, 5:1), 0.97 (BuOH-acetic acid-H<sub>2</sub>O, 4:1:1); amino acid analysis: Phe:Leu, 1:1.01; Anal. Calcd. for C<sub>22</sub>H<sub>35</sub>N<sub>3</sub>O<sub>3</sub>S 0.1 H<sub>2</sub>O: C, 62.41; H, 8.38; N, 9.92; S, 7.57. Found: C, 62.11; H, 8.19; N, 9.59; S, 7.94.

-19-

EXAMPLE 4

The following example demonstrates the method of testing for inhibitory activity.

## Collagenase Assay

Collagenase activity was determined after electrophoretic separation of degraded from undegraded type I collagen by polyacrylamide gel electrophoresis and densitometry as follows.

Acid-soluble calf skin collagen (0.25 mg/ml, approximately 0.8 M) was incubated at 35°C for 1 hr with pig synovial collagenase (0.04 g protein) in 0.05 M tris-HCL, 0.2 M NaCl, 0.25 M glucose, 5 mM CaCl<sub>2</sub>, 10% dimethyl sulfoxide, pH 7.6 in a total reaction volume of 20 L. Inhibitors were dissolved in dimethyl sulfoxide and the sulfhydryl titer determined in stock solutions immediately prior to use by the colorimetric procedure of Ellman [Ellman, G. L., Arch. Biochem. Biophys. 82: 70-77 (1959)]. At the end of the reaction period, the reactions were stopped by placing on ice and 20 L sample dilution buffer was added [Laemmli, U.K., Nature (London) 227: 680-685 (1970)]. The samples were then placed in a boiling water bath for 2-5 minutes after which collagen degradation products were separated from undegraded collagen by sodium dodecyl sulfate-polyacrylamide electrophoresis according to the procedure of Laemmli [1970]. The electrophoretograms were fixed in isopropanol/acetic acid/ water (100:40:300) and stained with 1% Coomassie Blue R-250. The percentage of collagen alpha chains degraded was estimated by scanning densitometry and integration of peak areas [Welgus et al., J. Biol. Chem. 256: 9511-9515 (1981)].

-20-

1 A spectrophotometric method was also utilized in some  
cases to determine collagenase activity [Lindy, S. et al.,  
5 European J. Biochem. 156: 1-4 (1986)]. The conditions were  
the same as given above except that the reaction volume was  
200  $\mu$ l, the temperature was 37°C and the enzyme concentration  
was 1.2 g protein/ml. Stock solutions of inhibitors were  
prepared in 1 mM acetic acid in ethanol and the sulfhydryl  
10 titer determined colorimetrically by the method of Ellman  
(1956). The reaction progress was monitored for 6-10 minutes  
by following the increase in absorbance at 227 nm that  
15 accompanies denaturation of the collagen fragments. Initial  
rates of collagen degradation were determined from the linear  
portion of the progress curves.

The results of the collagenase assays for a number  
15 of the present peptides are found in Table 1.

EXAMPLE 5

1 2-(R,S)-[Mercaptomethyl]-4-methylpentanoyl-L-cyclohexyl-L-alanine amide

5 To a solution of ( $\pm$ ) -2-acetylthiomethyl-4-methylpentanoic acid (5 mmole) the hydrochloride of the cyclohexylalanine-alanine-NH<sub>2</sub> and triethylamine (0.07 ml, 5 mmol) and dried methylene chloride (5 ml) was added (gradually over thirty minutes) 1-ethyl-3-(3-dimethyl-aminoisopropyl) carbodiimide hydrochloride (0.958 g, 5 mmol).  
 10 (cyclohexyl alanine is the aliphatic analog of phenyl alanine.) The reaction mixture was stirred for 1 hour at 0°C and then overnight at room temperature. The progress of the reaction was monitored by TLC. After completion of the reaction, ethyl acetate (50 ml) was added and the solution  
 15 was washed with 1 N HCl (3x 30 ml), 10% Na<sub>2</sub>CO<sub>3</sub> (3 x 30 ml), water (3 x 30 ml) and dried on Na<sub>2</sub>SO<sub>4</sub>. The product obtained after evaporation of the ethyl acetate was purified by crystallization or flash chromatography. The product was  
 20 dissolved in 2 ml methanol, flushed with nitrogen for 15-30 minutes and treated with dilute sodium hydroxide for 30-90 minutes. The resulting deprotected thiol was precipitated by adding water, acidified with acetic acid, and the product recovered by lyophilization. The formula of the product is

Using the procedure described hereinabove, and the hydrochloride of the appropriate amino acid or depeptide amide, the following compounds were also prepared:

-22-

EXAMPLE 6

Using the procedure of Example 4, herein, the collagenase activity for the compounds prepared in Example 5 was tested, giving the following results:

TABLE II

Approximate  $IC_{50}$  (M)

|   |      |
|---|------|

-23-

WHAT IS CLAIMED IS:

- 1 1. A compound of the formula:  
$$R_1SCH(R_2)CH(R_3)CO-AA_1[AA_2]_m[AA_3]_n-X$$
  
wherein m is the integer 0 or 1; n is an integer  
from 0-2;  
5  $AA_1$  is an hydrophobic amino acid;  
 $AA_2$  is an amino acid selected from the group  
consisting of alanine, glycine, leucine, isoleucine and  
phenylalanine;  
10  $AA_3$  is any amino acid;  
 $R_1$  is hydrogen, alkyl having from 1-10 carbon  
atoms, alkanoyl having from 2-10 carbon atoms, or aroyl  
having from 7-10 carbon atoms;  
 $R_2$  is hydrogen or alkyl having from 1-6 carbon  
atoms;  
15  $R_3$  is hydrogen, alkyl having from 2-10 carbon  
atoms, cycloalkyl having from 3-6 carbon atoms, aryl or  
arylalkyl, wherein aryl moieties have from 6-10 carbon atoms;  
 $X$  is  $NH_2$ ,  $OH$ ,  $OCH_3$  or  $OCH_2CH_3$ ;  
and salts thereof.  
20 2. The compounds of Claim 1 wherein  $AA_1$  is  
cyclohexylalanine, phenylalanine, naphthylalanine, tryptophan  
or tyrosine.  
3. The compounds of Claim 1 wherein  $AA_1$  is  
unsubstituted natural amino acid or mono-substituted with  
25 halide or alkyl containing 1 to 6 carbon atoms.  
4. The compound of Claim 2 wherein  $R_2$  is hydrogen  
or  $CH_3$ ,  $R_3$  is isobutyl,  $R_1$  is hydrogen and  $X$  is  $NH_2$  or  
 $OCH_2CH_3$ .  
5. The compound of Claim 2 wherein m is 1 and  $AA_2$   
30 is alanine.  
6. The compound of Claim 4 wherein m is 1 and  $AA_2$   
is alanine.

-24-

- 1        7. The compound of Claim 6 wherein n is 1 and AA<sub>3</sub>  
is arginine.
8. The compound of Claim 4 which has the formula  
HSCH<sub>2</sub>CH[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Phe-NH<sub>2</sub>.
- 5        9. The compound of Claim 4 which has the formula  
HSCH<sub>2</sub>CH[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Trp-NH<sub>2</sub>.
10. The compound of Claim 4 which has the formula  
HSCH<sub>2</sub>CH[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Phe-Ala-NH<sub>2</sub>.
11. The compound of Claim 4 which has the formula  
10        HSCH<sub>2</sub>CH[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Trp-Ala-NH<sub>2</sub>.
12. The compound of Claim 4 which has the formula  
HSCH<sub>2</sub>[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Nal-NH<sub>2</sub>.
13. The compound of Claim 4 which has the formula  
HSCH<sub>2</sub>[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Nal-Ala-NH<sub>2</sub>.
- 15        14. The compound of Claim 4 which has the formula  
HSCH<sub>2</sub>[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Phe-Leu-NH<sub>2</sub>.
15. The compound of Claim 4 which has the formula  
HSCH<sub>2</sub>[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Phe-Phe-NH<sub>2</sub>.
16. The compound of Claim 4 which has the formula  
20        HSCH<sub>2</sub>[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Phe-Ala-Arg-NH<sub>2</sub>.
17. The compound of Claim 4 which has the formula  
HSCH<sub>2</sub>[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Trp-Ala-Arg-NH<sub>2</sub>.
18. The compound of Claim 4 which has the formula  
HSCH<sub>2</sub>[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Nal-Ala-Arg-NH<sub>2</sub>.
- 25        19. The compound of Claim 4 having the formula  
HSCH<sub>2</sub>CH[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-cyclohexylalanine-Ala-NH<sub>2</sub>.
20. The compound of Claim 4 having the formula  
HSCH<sub>2</sub>CH[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-Phe-D-Ala-NH<sub>2</sub>.
21. The compound of Claim 4 having the formula  
30        HSCH<sub>2</sub>CH[CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>]CO-pCLPhe-Ala-NH<sub>2</sub>.

-25-

22. The compound of Claim 4 having the formula  
1  $\text{HSCH}_2\text{CH}[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO}-\text{N}(\text{CH}_3)-\text{Trp}-\text{NH}_2$ .

23. The pharmaceutical composition for treatment of  
collagenase-related disorders which comprises an effective  
amount of at least one compound having the formula:

wherein m is the integer 0 or 1; n is an integer  
from 0-2;

$\text{AA}_1$  is a hydrophobic amino acid;

10  $\text{AA}_2$  is an amino acid selected from the group  
consisting of alanine, glycine, leucine, isoleucine and  
phenylalanine;

$\text{AA}_3$  is any amino acid;

15  $\text{R}_1$  is hydrogen, alkyl having from 1-10 carbon  
atoms, alkanoyl having from 2-10 carbon atoms, or aroyl  
having from 7-10 carbon atoms;

$\text{R}_2$  is hydrogen or alkyl having from 1-6 carbon  
atoms;

20  $\text{R}_3$  is hydrogen, alkyl having from 2-10 carbon  
atoms, cycloalkyl having from 3-6 carbon atoms, aryl or  
arylalkyl, wherein aryl moieties have from 6-10 carbon atoms;

X is  $\text{NH}_2$ , OH,  $\text{OCH}_3$  or  $\text{OCH}_2\text{CH}_3$ ;  
and salts thereof.

24. The composition of Claim 23 wherein  $\text{AA}_1$  is  
25 phenylalanine, naphthylalanine, lysine, tryptophan, tyrosine  
or cyclohexylalanine.

25. The composition of Claim 23 wherein  $\text{AA}_1$  is  
unsubstituted natural amino acid or mono-substituted with  
alkyl containing 1 to 6 carbon atoms or halogen.

-26-

1           26. The composition of Claim 24 wherein  $R_2$  is  
hydrogen or  $\text{CH}_3$ ,  $R_3$  is isobutyl,  $R_1$  is hydrogen and X is  
 $\text{NH}_2$ .

5           27. The composition of Claim 24 wherein m is 1 and  
 $\text{AA}_2$  is alanine.

          28. The composition of Claim 26 wherein m is 1 and  
 $\text{AA}_2$  is alanine.

          29. The composition of Claim 28 wherein n is 1 and  
10  $\text{AA}_3$  is arginine.

          30. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2\text{CH}[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Phe-NH}_2$ .

          31. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2\text{CH}[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Trp-NH}_2$ .

15          32. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2\text{CH}[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Phe-Ala-NH}_2$ .

          33. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2\text{CH}[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Trp-Ala-NH}_2$ .

          34. The composition of Claim 26 wherein the  
20 compound has the formula  $\text{HSCH}_2[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Nal-NH}_2$ .

          35. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Nal-Ala-NH}_2$ .

          36. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Phe-Leu-NH}_2$ .

25          37. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Phe-Phe-NH}_2$ .

          38. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Phe-Ala-Arg-}$   
30  $\text{NH}_2$ .

35

-27-

1           39. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Trp-Ala-Arg-}$   
2            $\text{NH}_2$ .

5           40. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Nal-Ala-Arg-}$   
3            $\text{NH}_2$ .

          41. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2\text{CH}[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-}$   
4           cyclohexylalanine-Ala- $\text{NH}_2$ .

10           42. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2\text{CH}[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-Phe-D-Ala-}$   
5            $\text{NH}_2$ .

          43. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2\text{CH}[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-pCLPhe-Ala-}$   
15            $\text{NH}_2$ .

          44. The composition of Claim 26 wherein the  
compound has the formula  $\text{HSCH}_2\text{CH}[\text{CH}_2\text{CH}(\text{CH}_3)_2]\text{CO-N}(\text{CH}_3)\text{-Trp-}$   
20            $\text{NH}_2$ .

          45. A method of treating mammalian collagenase-  
25           related disorders which comprises administering to a mammal  
in need of treatment an inhibitory effective amounts of a  
30           compound of Claim 1.
